01 / FOUNDATIONS

FULL BODY RECOVERY

Build strength with consistent recovery habits - not extreme routines or quick fixes.

THE RECOVERY FORMULA

SLEEP + FOOD + FLUIDS + SMART TRAINING

01

Sleep to rebuild

Aim for 8-10 hours of sleep each night as a teen. A consistent bedtime supports muscle repair, energy and focus.

02

Eat enough and eat balanced

Include protein-rich vegetarian foods like paneer, tofu, lentils, curd, milk, chickpeas and soy, plus carbs, fruit and healthy fats.

03

Stay hydrated

Drink water regularly throughout the day and replace fluids lost during sweaty sessions. Thirst and urine color can help guide intake.

04

Respect rest

Give hard-trained muscles time to recover. Keep at least one easier or rest day weekly, and reduce intensity when unusually fatigued.

02 / PRACTICAL ROUTINE

TRAIN SMARTER

Recovery is personal. These time ranges are estimates, not strict rules.

AFTER A HARD SESSION

0-2 HOURS	Rehydrate and have a regular balanced meal or snack.
SAME DAY	Do gentle movement if comfortable; avoid extra hard sets.
NEXT 1-3 DAYS	Adjust training based on soreness, energy and performance.

MUSCLE RECOVERY - ROUGH GUIDE

Chest / Back	About 48-72 hours
Shoulders / Legs	About 48-72+ hours
Arms	About 24-72 hours

Hard or unfamiliar workouts may need longer. You can train other muscle groups while one recovers.

ACTIVE RECOVERY IDEAS

Easy walking, relaxed cycling, gentle stretching and mobility work can help you feel better without adding heavy fatigue.

Massage or foam rolling may ease soreness temporarily; cupping is not necessary for muscle growth or recovery.

03 / WEEKLY CHECKLIST

YOUR RECOVERY SYSTEM

Small habits, repeated consistently, make recovery more reliable.

7 HABITS TO CHECK

- [ ] Sleep 8-10 hours when possible
- [ ] Eat regular balanced meals with protein
- [ ] Drink water across the day
- [ ] Warm up before lifting
- [ ] Use good form and gradual progression
- [ ] Schedule rest or easier training
- [ ] Stop and assess pain rather than push through

WHEN TO GET HELP

Seek medical advice for persistent or worsening pain, swelling, major weakness, or fatigue that does not improve with rest.

If you have a diagnosed bone or calcium concern, ask a clinician before starting supplements or high-impact training.

REMEMBER

Progress happens when training and recovery work together.

Educational guide - not a substitute for individual medical care.
